## Solution to Problem 1

We say that two observations  $X_1$  and  $X_2$  are *independent* of one another with respect to a collection of events  $\mathcal{A}$  if

$$Pr\{X_i \in \cdot\}$$

In deciding whether your own observations are exchangeable and a permutation test applicable, the key question is the one we posed in the very first chapter: Under the null hypothesis of no differences among the various experimental or survey groups, can we exchange the labels on the observations without significantly affecting the results?
